

Welcome to TensorFlow!

CS 20:
TensorFlow for Deep Learning Research
Lecture 1
1/12/2018

Agenda

Welcome

Overview of TensorFlow

Graphs and Sessions

What's TensorFlow™?

“Open source software library for
numerical computation using data flow graphs”

Launched Nov 2015

Interest over time ?

Why TensorFlow?

- Many machine learning libraries

Denny Britz @dennybritz · 25 Dec 2017

I'm going through my newsletters to write up a year-end summary of developments and achievements in AI.

Fun fact: Almost every week, a company released a new generic or task-specific Deep Learning “framework” 😂

Why TensorFlow?

- Flexibility + Scalability

Originally developed by Google as a single infrastructure for machine learning in both production and research

Why TensorFlow?

- Flexibility + Scalability
- Popularity

Companies using TensorFlow

OpenAI

AIRBUS

Google DeepMind

nVIDIA®

Demand for tutorials on TensorFlow

Some cool projects using TensorFlow

Classify skin cancer

WaveNet: Text to Speech

It takes several hours to synthesize 1 second!

Drawing

Neural Style Transfer

Image Style Transfer Using Convolutional Neural Networks (Gatys et al., 2016)
Tensorflow adaptation by Cameroon Smith (cysmith@github)

I hope that this class will give you
the tool to build cool projects like
those!

Goals

- Understand TF's computation graph approach
- Explore TF's built-in functions and classes
- Learn how to build and structure models best suited for a deep learning project

CS20

Many of you are ahead of me in
academia so I probably need more
of your help than you do mine

Getting Started

```
import tensorflow as tf
```

Graphs and Sessions

Data Flow Graphs

TensorFlow separates definition of computations from their execution

Data Flow Graphs

Phase 1: assemble a graph

Phase 2: use a session to execute operations in the graph.

Data Flow Graphs

Phase 1: assemble a graph

This might change in the future with eager mode!!

Phase 2: use a session to execute operations in the graph.

What's a tensor?

What's a tensor?

An n-dimensional array

0-d tensor: scalar (number)

1-d tensor: vector

2-d tensor: matrix

and so on

Data Flow Graphs

```
import tensorflow as tf  
a = tf.add(3, 5)
```

Visualized by TensorBoard

Data Flow Graphs

```
import tensorflow as tf  
a = tf.add(3, 5)
```

Why x, y?

TF automatically names the nodes when you don't explicitly name them.

x = 3

y = 5

Visualized by TensorBoard

Data Flow Graphs

```
import tensorflow as tf  
a = tf.add(3, 5)
```

Nodes: operators, variables, and constants
Edges: tensors

Interpreted?

Data Flow Graphs

```
import tensorflow as tf  
a = tf.add(3, 5)
```

Nodes: operators, variables, and constants
Edges: tensors

Tensors are data.

TensorFlow = tensor + flow = data + flow
(I know, mind=blown)

Interpreted?

Data Flow Graphs

```
import tensorflow as tf  
a = tf.add(3, 5)  
print(a)
```

```
>> Tensor("Add:0", shape=(), dtype=int32)  
(Not 8)
```

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

Within the session, evaluate the graph to fetch the value of a

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

Within the session, evaluate the graph to fetch the value of a

```
import tensorflow as tf
a = tf.add(3, 5)
sess = tf.Session()
print(sess.run(a))
sess.close()
```

The session will look at the graph, trying to think: hmm, how can I get the value of a, then it computes all the nodes that leads to a.

How to get the value of a?

Create a **session**, assign it to variable `sess` so we can call it later

Within the session, evaluate the graph to fetch the value of `a`

```
import tensorflow as tf
a = tf.add(3, 5)
sess = tf.Session()
print(sess.run(a))    >> 8
sess.close()
```

The session will look at the graph, trying to think: hmm, how can I get the value of `a`, then it computes all the nodes that leads to `a`.

How to get the value of a?

Create a **session**, assign it to variable `sess` so we can call it later

Within the session, evaluate the graph to fetch the value of `a`

```
import tensorflow as tf
a = tf.add(3, 5)
sess = tf.Session()
with tf.Session() as sess:
    print(sess.run(a))
sess.close()
```

tf.Session()

A Session object encapsulates the environment in which Operation objects are executed, and Tensor objects are evaluated.

tf.Session()

A Session object encapsulates the environment in which Operation objects are executed, and Tensor objects are evaluated.

Session will also allocate memory to store the current values of variables.

More graph

Visualized by TensorBoard

```
x = 2
y = 3
op1 = tf.add(x, y)
op2 = tf.mul(x, y)
op3 = tf.pow(op2, op1)
with tf.Session() as sess:
    op3 = sess.run(op3)
```

Subgraphs

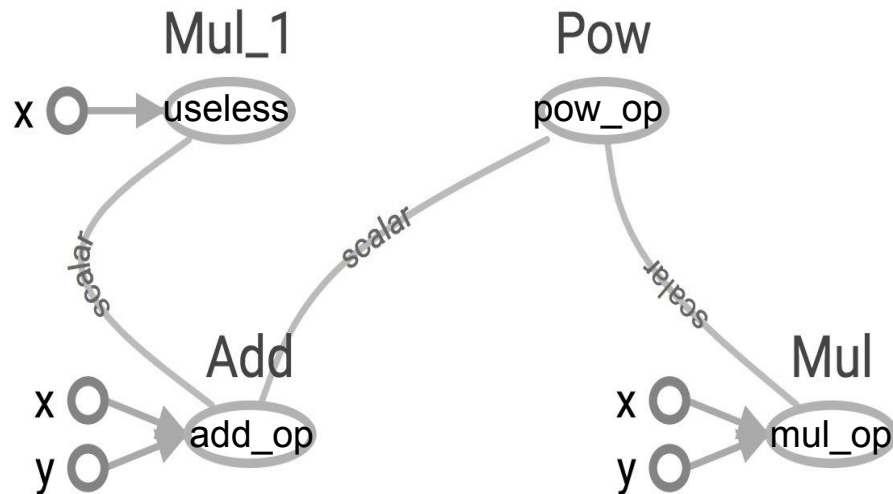

```
x = 2
y = 3
add_op = tf.add(x, y)
mul_op = tf.mul(x, y)
useless = tf.mul(x, add_op)
pow_op = tf.pow(add_op, mul_op)
with tf.Session() as sess:
    z = sess.run(pow_op)
```

Because we only want the value of `pow_op` and `pow_op` doesn't depend on `useless`, session won't compute value of `useless`
→ save computation

Subgraphs

```
x = 2
y = 3
add_op = tf.add(x, y)
mul_op = tf.mul(x, y)
useless = tf.mul(x, add_op)
pow_op = tf.pow(add_op, mul_op)
with tf.Session() as sess:
    z, not_useless = sess.run([pow_op, useless])
```

```
tf.Session.run(fetches,
                feed_dict=None,
                options=None,
                run_metadata=None)
```

fetches is a list of tensors whose values you want

Subgraphs

Possible to break graphs into several chunks and run them parallelly across multiple CPUs, GPUs, TPUs, or other devices

Example: AlexNet

Distributed Computation

To put part of a graph on a specific CPU or GPU:

```
# Creates a graph.
with tf.device('/gpu:2'):
    a = tf.constant([1.0, 2.0, 3.0, 4.0, 5.0, 6.0], name='a')
    b = tf.constant([1.0, 2.0, 3.0, 4.0, 5.0, 6.0], name='b')
    c = tf.matmul(a, b)

# Creates a session with log_device_placement set to True.
sess = tf.Session(config=tf.ConfigProto(log_device_placement=True))

# Runs the op.
print(sess.run(c))
```

**What if I want to build more
than one graph?**

**You can
but you don't need more than one graph
The session runs the default graph**

But what if I really want to?

URGH, NO

BUG ALERT!

- Multiple graphs require multiple sessions, each will try to use all available resources by default
- Can't pass data between them without passing them through python/numpy, which doesn't work in distributed
- It's better to have disconnected subgraphs within one graph

I insist ...

tf.Graph()

create a graph:

```
g = tf.Graph()
```

tf.Graph()

to add operators to a graph, set it as default:

```
g = tf.Graph()
with g.as_default():
    x = tf.add(3, 5)
sess = tf.Session(graph=g)
with tf.Session() as sess:
    sess.run(x)
```

tf.Graph()

To handle the default graph:

```
g = tf.get_default_graph()
```

tf.Graph()

Do not mix default graph and user created graphs

```
g = tf.Graph()
```

```
# add ops to the default graph
```

```
a = tf.constant(3)
```

```
# add ops to the user created graph
```

```
with g.as_default():
```

```
    b = tf.constant(5)
```

Prone to errors

tf.Graph()

Do not mix default graph and user created graphs

```
g1 = tf.get_default_graph()  
g2 = tf.Graph()
```

```
# add ops to the default graph  
with g1.as_default():  
    a = tf.Constant(3)
```

```
# add ops to the user created graph  
with g2.as_default():  
    b = tf.Constant(5)
```

Better

But still not good enough because no more than one graph!

Why graphs

1. Save computation. Only run subgraphs that lead to the values you want to fetch.

Why graphs

1. Save computation. Only run subgraphs that lead to the values you want to fetch.
2. Break computation into small, differential pieces to facilitate auto-differentiation

Why graphs

1. Save computation. Only run subgraphs that lead to the values you want to fetch.
2. Break computation into small, differential pieces to facilitate auto-differentiation
3. Facilitate distributed computation, spread the work across multiple CPUs, GPUs, TPUs, or other devices

Why graphs

1. Save computation. Only run subgraphs that lead to the values you want to fetch.
2. Break computation into small, differential pieces to facilitate auto-differentiation
3. Facilitate distributed computation, spread the work across multiple CPUs, GPUs, TPUs, or other devices
4. Many common machine learning models are taught and visualized as directed graphs
